Dear ATC 810/820 Owner,

ATC introduces it's new full color Visual Display System for use on any ATC 810 or 820 Multi Engine Flight Simulator. The new ATC Visual System provides day, dawn/dusk, or night scenes generated by a sophisticated digital computer updating 30 times a second. This fast update rate provides real time performance of ATC's new system, which totally eliminates the annoying lag associated with other 'so called' low cost systems.

This visual system is displayed through an infinity optical arrangement which causes the pilot's eyes to focus to infinity when viewing the display. This provides a level of realism not found in visual systems generally offered in this marketplace. The optical arrangement also provides realistic depth perception to the objects being viewed 'out the window'.

ATC's visual system is available in both a single pilot and a dual pilot configuration. The dual pilot configuration provides the copilot with the same outside view as the pilot. The dual pilot visual display is only available for use with ATC 820s and 920s.

If you think your flight training department can benefit from ATC's new Visual Display System please contact ATC Flight Simulator Co. to discuss retrofitting to your existing ATC 810/820.
